Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- (previously presented) Method for determining the suitability of a digitized image of a person for person identification, with the steps:
 - segmenting the image of a person into a background area and a head or face area,
 - analyzing the head or face area to determine at least one characteristic value.
 - comparing the at least one characteristic value with at least one predetermined threshold value, and
 - making a determination of the suitability of the image based on a result of the comparison.
- (original) Method according to claim 1, wherein the step of segmenting comprises performing a method for object recognition.
- (previously presented) Method according to claim 1, wherein analyzing the head or face area comprises detecting at least one geometric feature of the head or face area.

- 4. (original) Method according to claim 3, wherein detecting at least one geometric feature of the head or face area comprises a size and/or shape and/or position and/or spatial orientation of the head or face area within the image of a person.
- (previously presented) Method according to claim 1, wherein analyzing the head or face area comprises detecting at least one reproduction feature of the head or face area.
- 6. (original) Method according to claim 5, wherein the at least one reproduction feature that is to be detected comprises a contrast and/or a color distribution and/or a sharpness of the image and/or a brightness and/or a grade of staining and/or a measure for the irradiation of the head or face area.
- (previously presented) Method according to claim 1, wherein analyzing the head or face area comprises localizing sub-regions of the head or face area.
- (original) Method according to claim 7 with the additional step: analyzing the at least one localized sub-region.
- (previously presented) Method according to claim 1 with the step: analyzing the image of a person with respect to global criteria that apply to the entire image of a person.

- (previously presented) Method according to claim 1 with the step:
 analyzing the background area of the image of a person.
- (previously presented) Method according to claim 1 with the step: determining whether a negatively evaluated image could fulfill the predetermined quality criteria after image correction.
- 12. (previously presented) A correction method for a digitized image of a person, which does not fulfill one or more quality criteria during a verification method according to claim 1, comprising correcting at least one image reproduction feature in the entire image and/or the head or face area and/or the background area, and/or correcting at least one geometric feature of a head or face area displayed in the image of a person.
- (previously presented) A data processor, adapted to execute a method according to claim 1.
- (previously presented) A data processor, adapted to execute a method according to claim 12.
- 15. (currently amended) A data processor, adapted to execute a verification determination method according to claim 1 and to execute a correction method for a digitized image of a person, which does not fulfill one or more quality criteria during the verification determination method, comprising

correcting at least one image reproduction feature in the entire image and/or the head or face area and/or the background area, and/or correcting at least one geometric feature of a head or face area displayed in the image of a person.

- 16. (currently amended) System for quality verification <u>determination</u> and correction of digitized images of persons comprising a storage means for storing digitized image data, and one of a first data processing means for executing a method according to claim 1 and a second data processing means for executing a correction method for a digitized image of a person, which does not fulfill one or more quality criteria during a <u>verification</u> <u>determination</u> method according to claim 1, comprising
 - correcting at least one image reproduction feature in the entire image and/or the head or face area and/or the background area, and/or correcting at least one geometric feature of a head or face area displayed in the image of a person, and
 - a data processing means for executing a verification determination method according to claim 1 and for executing a correction method for a digitized image of a person, which does not fulfill one or more quality criteria during the verification determination method, comprising
 - correcting at least one image reproduction feature in the entire image and/or the head or face area and/or the background area, and/or correcting at least one geometric feature of a head or face area displayed in the image of a person.

- (original) A system according to claim 16 comprising an apparatus for generating digitized image data.
- (previously presented) A system according to claim 16 comprising a display device for displaying whether a verified image or a modified image observes predetermined quality standards.
- (previously presented) Method according to claim 2, wherein analyzing the head or face area comprises detecting at least one geometric feature of the head or face area.
- (previously presented) Method according to claim 2, wherein analyzing the head or face area comprises detecting at least one reproduction feature of the head or face area.
